
Performance summary

As Amazonians, we raise our performance expectations to meet customers' rising expectations. The performance summary represents how you performed compared to expectations for your role and level. There are 3 possible performance summaries: Exceeds High Bar, Meets High Bar, and Needs Improvement. To determine your summary, your manager reflected on your work using information gathered throughout the year, along with peer feedback and your self-evaluation.

Your Performance summary:

Meets High Bar

Your performance this year met Amazon's high performance bar for your role and level. Your contributions met expectations in delivering for your customers.

Leadership Principles summary

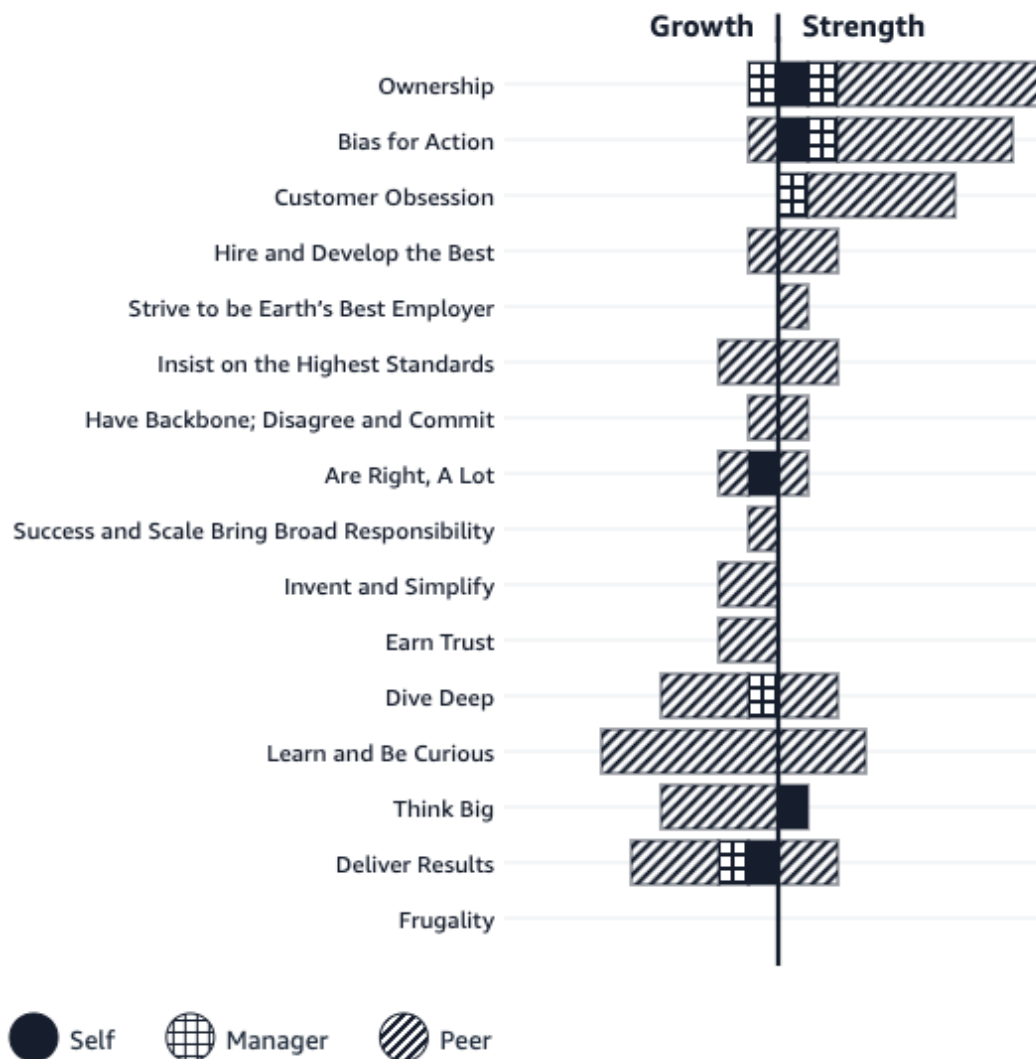

The Leadership Principles help define our culture, represent how we innovate on behalf of customers, and underpin how Amazonians work. The Leadership Principles summary explains your effectiveness at demonstrating Leadership Principles while delivering for customers at your current role and level. There are three Leadership Principles summaries: Role Model, Solid Strength, and Development Needed.

Your Leadership Principles summary:

Solid Strength

You consistently demonstrate Amazon's Leadership Principles in how you work. You are strong in many Leadership Principles and continue to grow in others.

Your growth and strength Leadership Principles

Super powers

A super power is an exceptional strength - one that stands out most about you.

Your self-reflection

Describe what you're most excited about at work

Investigating new problems/opportunities that need to be solved or taken advantage of, writing a doc to gather feedback, planning an execution and exit strategy to deliver on that product or service.

Working towards career goals. The ability at AWS to involve myself in anything that complements my role guidelines and career progression is brilliant and perfectly suits my personality.

Describe how you contribute when you're at your best

Identify 1 door vs 2 door decisions and to act quickly on those 2 way door decisions. I prefer to err on the side of speed over perfection because I feel that perfection can be an iterative process with 2 way door decisions.

Bias for Action. If an opportunity presents itself, I like to jump for it and think out a plan as I'm jumping. This allows me to help others quickly where they might be blocked without that help/volunteering from others and deliver at speed.

Think Big. Identifying how a success might be able to be turned into a bigger success.

Manager feedback

You bring a lot of strengths to your work at Amazon. What stands out for me is:

Since joining, James has demonstrated a keen drive to take on new problems, engage with stakeholders, and impact the experience of users. James seeks feedback often and adapts to it. James' enthusiasm is infectious within the team and much appreciated.

Shared April 3, 2024

Peer feedback

James always insists on the highest standards when providing feedback and guidance. He is a natural mentor, leveraging both his strong technical skills and experience to help others in a constructive and clear manner. He also takes opportunities to learn about the end user, for example attending a meeting where SAs evaluate each others TAPs and investigated their pain points.

James excels at engaging customers and incorporating their feedback into projects like TAP. His outgoing nature helps him build strong customer relationships. For example, James' presentation at the tech summit directly led to two user observation sessions of solution architects using TAP. His customer focus, initiative, and ability to connect are strengths that benefit the TAP project.

James has been someone I can rely on for help and support with customer engagements. He takes ownership of tasks and I've found him to be particularly great at putting customers at ease with technical subjects such as event driven architecture.

James has demonstrated his ability to take Ownership of designing and delivering components of Tap Tool, embracing continuous learning from team members, and focusing on software improvement. He always seeks diverse perspectives, and adapts based on peer feedback. His work on frontend positively impacted user experience, but also code quality and maintainability. He started influencing technology decisions, by contributing to narratives.

James is a hard working and curious minded whose super power is curiosity and execution, these sets him apart as an individual who is deep toes into many initiatives and comes at the top.

James is keen to take risks, generous with his time whenever help is needed, he approaches challenges with a positive attitude and happy to swim outside of his comfort zone. He is a good communicator and he is not intimidated by talking to multiple stakeholders and multiple teams.

James is very helpful speaking up in a team environment. Even though communication is key, not everyone, especially new hires, can easily make sure to do it and do it clearly. He's also volunteered to help out with team activities and events and his visibility is a big plus.

James superpower ids his technical depth with web app design using React and Ampilfy. When my workshop for needed expert advice to achieve the UX we needed, James was able to get on a call and help write code in real time over a shared chime session. The workshop ran at re:Inforce and re:Invent, content CSAT of 4.67.

James was willing to dive straight in on a short timeline project for the tech summit. He required very little guidance and took ownership of the development of distinct chunks of the task. He also regulary demonstrates L&BC in our team retrospectives and other such meetings, offering up valuable opinions and willing to query things that don't seem clear at first. Taking ownership of the fortnightly team activity has been a great success and something I think we should continue

James' super-power is his ability to distill complex programming challenges into understandable and implementable solutions, helping others to gain confidence and grow.

James's super power is without doubt his enthusiasm and "team spirit". He is always amongst the first within the team to volunteer to help when help is needed. He adds value on every engagement you have with him and often his different perspective makes you realise something has been missed and results in a more complete proposal or solution.

James's superpower is his proactiveness on taking initiatives on the project as well as the whole team. He has taken some good initiatives like TAP frontend refactoring, setting up bug ticket rotas, organising talks in summit, virtual fun and discussion sessions, which I've found to have a positive impact on the team.

Growth ideas

Growth ideas are suggestions of things you can do to develop and grow.

What growth ideas do you have for yourself?

Be right, a lot. By picking a focus area/specialty within the AWS services, I can begin to dive deep and become a source of knowledge for others to seek out.

Deliver results. I want to focus much more on breaking down larger tasks into smaller ones to

enable others to share the load and to help deliver results gradually over time rather than one large result at the end.

Manager feedback

Growth ideas from me:

For growth, James could focus on timely delivery on customer outcomes, deepening his architectural knowledge, and taking the time to reflect on which technology areas are the most inspiring or the strongest so that he can lean into them. I would also like to see James publish some public-facing content and gain experience of the process to do so.

Shared April 3, 2024

Peer feedback

I would like to see James continue his discovery into the experiences of the end users for the tools he works on. I think this could provide great value and insight into the development process.

James has shown initiative in working on new ideas like refactoring frontend code, a visual refresh, and frontend architecture changes for the TAP project. To take these ideas to the next level, he could focus on seeing a few key initiatives through completion by setting milestones and timelines. This focus will allow him to execute at a higher level.

I would love to see James scale out his technical expertise with more public facing sample code/reference architectures/blogs that can help our customers on-board faster.

I'd like to see James focusing on timely delivery that is aligned with customer requirements and goals. To continue growing, he would need to deepen his understanding of architectural design principles, and learn how to make effective design trade-offs. Honing his communication skills would help to collaborate effectively, verbally and in writing, with peers and both technical and non-technical stakeholders.

James as an area for growth in bias for action as much as curiosity goes some things need more priority than other.

James is still forging his technical backbone and while he has demonstrated to be keen and happy to ask/receive help from others, he can balance that a bit better. When getting stuck, he needs to try to break down problems autonomously and improve self-confidence. In particular, being familiar with frontend, he may benefit from learning more about backend, perhaps starting with core concepts such as API design.

One growth idea for James might be more receptive, active, critical, and effective listening. As we know each and all colleagues and customers come with different experiences and perspectives, I think it would help him become a much stronger builder and speaker.

My growth advice for James would be to scale through others by helping SA's across the sales org to upskill on modern application development. We have a lot of tools that can

help with MAD but very few SA's know how to use many of them beyond the marketing materials. Producing a hands on maven class could be a goal.

It'd be great to see James branching out from TAP and committing to other projects. In addition, I think James should aim to do at least one brunch and burn in 2024 as he clearly accumulated a lot of knowledge since joining AWS. If not already, it'd be worthwhile James specialising in a particular area such as Frontend dev

Don't be afraid to challenge requestors vision for what the solution should be. In retrospect I spent maybe too much time obsessing over creating a pretty front-end when a scrappier solution could have been more impactful.

James should believe in himself a bit more. He regularly puts himself outside of his comfort zone, but doing so means he is more comfortable than most in doing this so do not hold back have confidence in yourself. I would love to see James taking the lead in some projects to showcase his skills as a leader.

I'd like to see James work on building his technical skills. For example, learn more about writing more maintainable and reliable code and tests. Apart from programming part, he could work on building knowledge about AWS Services, running and debugging in the cloud by playing around with the services.

Thank you!
